

Moss Design Installation

made of natural Iceland moss in combination with a unique subsurface and coated surface structure. The panels can be extended with the same design structure in all directions.

Iceland moss, Latin *Cetraria islandica*, developed more than 400 to 450 million years ago and has been shown to help with respiratory disorders.

The homogeneous structure of the Iceland moss with the graphical embedment into the coated subsurface combines nature-based design (so-called biophilic design) with modern design requirements.

The use of different colours and the innovative production process allows individual designs to be implemented, e.g., using imagery or designs in compliance with corporate identities.

Consequently, art aqua moss installations are an integrative component of holistic room design.

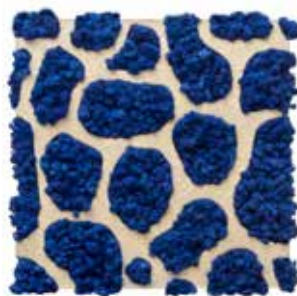

art aqua moss products require no irrigation. They improve room acoustics and, thanks to their structure, are antistatic.
